Non Functional Requirements

Non-functional requirements define the quality attributes and performance expectations of the Flood Prediction System.

1. Accuracy

The system should provide reliable flood predictions with good model accuracy.

2. Performance

The application should provide prediction results quickly after receiving user inputs.

3. Usability

The interface should be simple, user-friendly, and easy to understand.

4. Reliability

The system should work consistently without frequent failures.

5. Scalability

The system should support increasing amounts of data and future improvements.

6. Security

User inputs and system data should be handled securely.

7. Maintainability

Text Document

The code should be organized properly so that future modifications and updates can be performed easily.
