Database Design

Overview

The Flood Prediction System mainly uses datasets for storing historical flood information and environmental parameters.

Dataset Structure

The dataset contains the following attributes:

Attribute	Description
-----	-----
Latitude	Location coordinate
Longitude	Location coordinate
Rainfall	Amount of rainfall
Elevation	Height above sea level
Slope	Land surface inclination
Distance	Distance from water source
Duration	Flood duration
Risk Level	Flood prediction output

Data Storage

The system stores:

- Historical flood records
- Training data
- Testing data
- Prediction results

The dataset is used for training and improving the machine learning model.
